

Playwright REPL with Hot Reload + Sessions

This project is a custom TypeScript-powered **interactive REPL** for Playwright, enhanced with:

- **V** await support for Playwright commands
- Protein Hoter Hotel Ho
- Persistent browser sessions via storageState
- Real autocompletion and command history
- Preloaded aliases like goto(), ss(), and text()

M Installation

```
pnpm install
npx playwright install
```

Requires Node.js \geq =18. Works best with tsx.

Getting Started

pnpm tsx scripts/playwright-repl.ts

Available Globals in REPL

Binding	Description
browser	Chromium browser instance
context	Browser context (isolated profile)
page	The current page tab
ss(name?)	Screenshot with timestamp filename
goto(url)	Shortcut for page.goto(url)
text(sel)	Get inner text of element
eval(fn)	Shortcut for page.evaluate(fn)
.editor	Open multi-line input mode
·	· · · · · · · · · · · · · · · · · · ·

Binding Description

.exit

Quit the REPL

Session data is saved on exit and restored on launch using Playwright's storageState.

- ₱ File: storage/session.json
- Keeps cookies, localStorage, and login sessions
- 🔄 Automatically loaded if it exists

Hot-Reloadable Helpers

Your helpers live in:

```
scripts/playwright-repl-helpers.ts
```

Every time you save this file, the REPL automatically reloads your updated helpers without restarting the browser or REPL.

You can customize this file to include your own commands and debugging tools.

Project Structure

```
scripts/
├── playwright-repl.ts # Entry REPL script
├── playwright-repl-helpers.ts # Hot-reloadable helper functions
storage/
└── session.json # Browser session state
```

★ Future Enhancements

- Multiple session profiles (e.g., admin, guest)
- IncresetSession command
- Cookie inspector / header dumper
- Custom commands for intercepting network requests

```
await goto('https://example.com')
await text('h1')
await ss('homepage')
```

♥ Credits

Crafted with love, caffeine, and drama. Inspired by Playwright, styled for legends.
